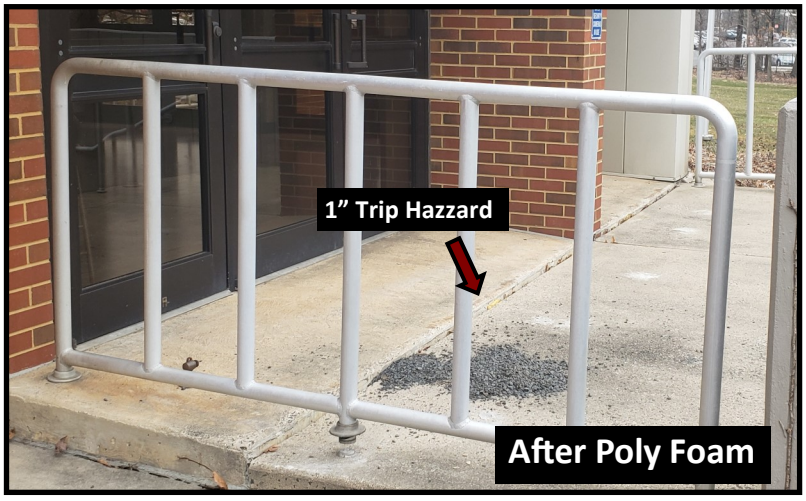
**Project:** Commercial Top Landing Settlement **Date:** March, 2019

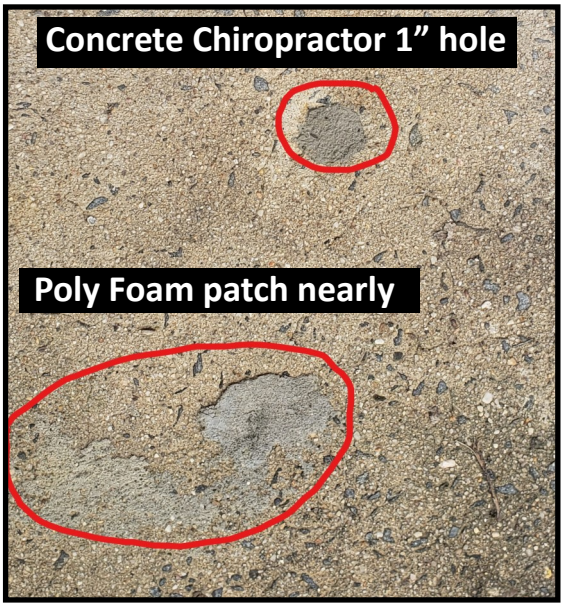
**Location:** Middlesex County College, Middlesex NJ



**Problem: Settled slab on the top landing of a main entrance step, creating a major tripping hazard**

To raise the slab, the college's facilities management first chose a local, multi-service company. Company representatives claimed they could raise the slab through a ⅝ inch hole pumping in a newer, superior product (poly foam) over concrete mudjacking

After two different attempts, including one with an onsite consultation with the company's poly-leveling manager, the slab was not lifted. Both attempts left unsightly holes closer to 3" inches in diameter. The contractor's work order was cancelled.



**Solution: Hire a mudjacking specialist to fix the job**

Unlike the prior contractor, Concrete Chiropractor specializes in concrete raising. Our technicians raised and stabilized the slab back to its original height, therefore removing the tripping hazard. Our process pumped a lab-tested, natural product into smaller holes than left behind by the prior contractor, gradually lifting the slab.

**End result: Satisfied client**

A representative from the college's facilities management happily stated, "You are true experts in concrete raising, and you will be our go-to contractor from this point forward."

**Project Summary**

Concrete Chiropractor was able to save the project where others had failed. While competitors heavily market a variety of products and services, we only specialize in concrete repair. Our time proven system and product is backed up with a solid warranty. Our reputation speaks for itself, demonstrated repeatedly by our satisfied clientele and their referrals.
